PROJECT CONTROLS INSTITUTE GLOBAL

PCI AI Certification Body of Knowledge Suite

Audit, verification, law framework, renaming, indexing and publication programme

AUDIT REPORT PACKAGE
2026-08-04

PCL-AI · PFL-AI · PML-AI

Read before quoting any readiness claim. No named human subject-matter expert has reviewed this material. The corpus was AI-drafted, and so was this programme's work on it. Gate 3 (technical review) and Gate 13 (final approval) are recorded as not started. See the Executive Audit Report §5 and the Sign-Off Register §1.

Executive Audit Report — PCI AI Certification BoK Suite

Programme: PCI AI Certification BoK Suite — audit, verification, law framework, renaming, indexing and publication
Report date: 2026-08-03
Volumes: PCL-AI (PCI AI Project Controls Leader) · PFL-AI (PCI AI Project Finance Leader) · PML-AI (PCI Project Management Leader – AI)

1. The headline

The three volumes are, on their technical substance, in far better condition than their presentation suggested. Across roughly 145 independently recomputed results — spanning earned value, IFRS 15 percentage-of-completion, CPM and crashing, PERT, Monte Carlo and merge bias, time value of money, debt sizing and sculpting, coverage ratios and drawdown — **one genuine arithmetic defect was found**, in a PFL-AI drawdown example whose printed addends did not sum to their printed total. That is an unusually low defect rate for 1.1 million words of quantitative reference material, and it substantiates the programme's machine-verification claim.

What blocked publication was not the mathematics. It was that all three volumes were **build artifacts wearing the clothes of finished books**: internal production metadata printed on all 45 domain title pages, planning labels in reader-facing headings and running heads, repository paths in the appendices, two stub appendices promising content that did not exist, and — in the two draft volumes — an answer-key marker that silently vanished in print, deleting the correct answer from all 813 sample MCQs.

All of that is now fixed. The volumes rebuild clean, carry a coherent PCI Standard framework, and the retired PCP-AI identity is gone from published content. **What remains outstanding is the one thing no amount of further automated work can supply: named human subject-matter review.**

2. Publication readiness

	PCL-AI	PFL-AI	PML-AI
Pages (rebuilt)	947	802	822
Domains / Knowledge Areas	13 / 61	16 / 61	16 / 63
Worked examples	146	179	161
Sample MCQs	309	450	363
Case studies	26	33	33
Figures	33	46	51
Machine-verified calculations	**none — no suite exists**	7,935	7,678
Professional Laws (foundational + certification)	14 + 20	14 + 24	14 + 24
Readiness	**Amber** — releasable as study material once reviewed	**Amber**	**Amber**

No volume is Green, and none should be described as release-ready, for one reason stated plainly in §5. No volume is Red: there is no longer a known defect that would mislead a candidate.

3. Critical findings, and their disposition

#	Finding	Volumes	Status
C-1	Internal production spec blocks ("Target: ~68 pages. Binds to: …") printed on every domain title page — several containing impossible ordinals ("Domain 7 of 6")	all three (45 domains)	**Fixed** — stripped from source, preserved separately for notation reinstatement
C-2	MCQ correct-answer markers rendered as blank space: the emoji glyph exists in no build-host font, so the answer key was invisible in print for all 813 MCQs	PFL, PML	**Fixed** — replaced with a font-safe boxed "✓ CORRECT" chip; verified 450 and 363 render
C-3	Appendix E (self-check answers) and Appendix F (MCQ bank) were stubs promising content the book did not contain, in a volume presented as a First Edition	PCL	**Fixed** — 129 self-check answers and all 309 MCQs extracted into real appendices
C-4	Volume presented as a finished First Edition with no AI-drafting disclosure, while its sibling volumes carried one	PCL	**Fixed** — production, verification, laws, errata and release-approval front matter added
C-5	Retired credential identity (PCP-AI / Certified Project Controls Professional) live throughout the volume the platform had already migrated away from	PCL + platform	**Fixed** — 392 replacements across 87 files; zero unauthorised residuals
C-6	Two governing principles in circulation across one credential family	all three	**Fixed** — one wording everywhere; legacy wording retired with a recorded note
C-7	The PCL law set was severed from the foundational hierarchy it is declared subordinate to — zero cross-references where its siblings had 39 and 55	laws	**Fixed** — 41 cross-references added
C-8	An implied ISO/IEC 17024 accreditation claim, and voluntary/supervisory instruments (Basel, COSO, Scrum Guide, FAST, IESBA, OECD) characterised so they could read as binding	laws	**Fixed** — every instrument verified with its publisher; non-binding status stated at point of use

4. Major findings

- **A symbol collision that would mislead a candidate.** `EAC` meant equivalent annual cost in PFL-AI Domain 4 and estimate at completion in Domain 8 — two different quantities, in different units of meaning, under one symbol, in one book. Domain 4 now uses `EAV`, matching the shared registry. No arithmetic changed.
- **A verification record that recorded a verification that could not have happened.** A PCL-AI toolkit logged an AI-drafted EAC of 1,180,000 as "recomputed and verified", but no method on that data yields it. The row now shows the check catching the discrepancy and returning the figure unreleased — which is what the control is for, and a better lesson than the original.
- **A figure illustrating a different data set from the text it sat beside** (PCL-AI Fig 10.3.1, crash costs). Re-specified to the worked examples' own numbers.
- **Date-sensitive standards taught as current.** IFRS 18 replaces IAS 1 for periods from 1 January 2027 — under six months out — and ISO/IEC 27701:2025 became standalone rather than an extension. Forward notes added; the register now carries verification dates.
- **Register defects.** The external-authority register tagged the IFRS Conceptual Framework as an accounting standard (the IASB states expressly that it is not one) and recorded that Basel appeared in no law file when it is cited six times. Both corrected; eleven instruments the laws cite that no register carried are now registered.

5. What is NOT done, and why it matters most

No named human subject-matter expert has reviewed any of this material. The corpus was AI-drafted end to end. Everything this programme added — 82 Professional Laws, the registers, the appendices, the corrections — was also AI-produced, reviewed by independent adversarial agents rather than by people.

A passing verification suite and a clean red-team pass establish something real but narrow: the arithmetic is right, the citations resolve to real instruments, the structure conforms, and no voluntary framework is described as legislation. **They do not establish that the pedagogy is sound, that the professional judgements are ones an experienced practitioner would endorse, that the emphasis is right, or that nothing important is missing.**

The evidence for that limit is in this programme's own results: of the eight calculation-assurance defects found, **four were not arithmetic errors at all** — they were interpretation, precision, illustration and record-keeping defects that a machine suite passed and a human reading caught. That ratio is the argument for Gate 13.

Nothing in these volumes should be presented to a candidate, an employer, a regulator or an accreditation body as reviewed material until that review is recorded.

6. Gate status

Gate	Status	Note
1 — Inventory complete	**Pass**	Scripted inventory across all 45 domains; see §2
2 — Naming complete	**Pass**	Zero unauthorised retired-name occurrences; see the Naming Migration Report
3 — Technical review complete	**FAIL — not started**	Requires named subject reviewers
4 — Calculation verification	**Partial**	15,613 checks passing for PFL + PML; **no suite exists for PCL-AI**
5 — Laws framework complete	**Pass, with gaps recorded**	82 laws; seven domains carry no anchored law (listed in the issue register)
6 — External references verified	**Pass**	70 registered + 11 added; 41 independently verified with publishers
7 — Cross-book consistency	**Pass**	One principle, one credential-name set; 8 legitimate term collisions documented, not collapsed
8 — Examination review complete	**Partial**	Structural checks pass and answer keys now print; no examiner has reviewed the items
9 — Copyright and originality	**Pass on evidence available**	No standard text reproduced; all cases fictitious; no third-party diagram used
10 — Editorial and accessibility	**Partial**	Call-out system never relies on colour alone; no accessibility audit of the rendered PDFs
11 — Indexing complete	**Partial**	Subject, figure, formula, glossary, standards, toolkit, capstone and laws indexes present; no consolidated cross-book concept index
12 — Independent red-team	**Pass**	Two adversarial passes on the laws; three on the volumes

Gate	Status	Note
13 — Final human approval	**FAIL — not started**	The gate that matters, and the one that cannot be delegated

7. Recommended release decision

Do not release as a professional standard. Release is defensible only as clearly-labelled study material, and only after Gate 3.

In priority order:

1. **Appoint named technical reviewers** — one per volume, plus a finance reviewer for PFL-AI and an examiner for the MCQ banks. This is the binding constraint on everything else.
2. **Build the golden-answer suite for PCL-AI.** It is the only volume whose numbers rest on sampling, and it is the volume currently presented as a First Edition.
3. **Decide the page-length question.** Both draft volumes sit ~800 pages against a 1,200-page target. The programme's own analysis is that the gap cannot be closed honestly within the current syllabus; the three defensible answers (extend the syllabus, split into core and advanced volumes, or revise the target) are a scheme-owner decision, not an editorial one.
4. **Decide the website question.** The retired governing principle remains on roughly 220 live public pages (306 occurrences), including SEO structured data where it appears as a registered slogan. The books and the site would otherwise state different governing principles for the same credential family. This was deliberately left unchanged — rewriting the public marketing estate is a publishing decision, not an audit correction — but it should not stay open long.
5. **Close the seven unanchored domains** in the law framework, most notably PCL-AI Domain 2, the IFRS 15 flagship, which carries no law at all.

Master Issue Register — PCI AI Certification BoK Suite

Programme: PCI AI Certification BoK Suite audit · **Report date:** 2026-08-04 (critical findings closed and volumes rebuilt)
Source: professional-completeness audit of all 45 domains across the three volumes, by six independent auditors, plus three deep technical reviews and two adversarial law red-team passes.

---

1. How to read this register

This register records issues found by the **completeness audit** — the pass that asked, of every Knowledge Area, whether the professional treatment is complete: decision rights, evidence, controls, escalation, retention, external-standard characterisation, jurisdictional caveats and AI limits.

It deliberately does **not** repeat the defects already fixed and recorded elsewhere: the naming conversion (see `NAMING_MIGRATION_REPORT.md`), the calculation defects (see `CALCULATION_ASSURANCE.md`), and the production-artifact defects — spec-block leakage, tier labels, stub appendices, the invisible MCQ answer key — recorded in `EXECUTIVE_AUDIT_REPORT.md` §3.

Severity. Critical — unsafe, legally misleading, professionally indefensible or publication-blocking. Major — incomplete professional treatment, missing governance or evidence requirement, inconsistent terminology. Moderate — weak explanation, insufficient example, unclear wording, thin sector variation.

Status. Every issue is recorded **Open** unless this programme closed it. Nothing here has been reviewed by a named human; see `SIGN_OFF_REGISTER.md`.

2. Summary

Severity	Count	PCL-AI	PFL-AI	PML-AI
Critical	5	2	1	2

Severity	Count	PCL-AI	PFL-AI	PML-AI
Major	40	16	12	12
Moderate	12	2	5	5
Total	**57**	20	18	19

No auditor found a defect in the arithmetic. All 57 issues are in the professional, governance and legal layer — which is precisely the layer a verification suite cannot reach, and the reason Gate 3 (named technical review) is the binding constraint on release.

3. Recurring themes

Five patterns account for most of the register, and each is cheaper to fix as a pattern than issue-by-issue:

1. **Accountability is asserted but not operationalised.** Domains repeatedly say a professional is accountable without stating a duty to escalate, a dissent record, an approver, a threshold or a prohibition. Much of the missing substance already exists — in the 82 Professional Laws drafted by this programme — but the books never cross-reference them (zero law citations across all three volumes).
2. **External anchoring is absent from flagship domains.** The EVM flagship cites no ANSI/EIA-748 or ISO 21508; the AI domain of an AI-named credential cited no AI authority at all until this programme fixed it.
3. **Record retention is required but never specified** — no period, custodian or jurisdictional note — while other material (delay analysis, agile assurance) depends on those records surviving.
4. **AI blocks state the verification duty everywhere and the confidentiality prohibition nowhere**, and are missing entirely from several of the highest-risk Knowledge Areas.
5. **Jurisdiction-sensitive statements made as universals** — the clearest being a tax passage asserting that VAT and withholding "neither changes project cost", which is wrong for irrecoverable VAT and non-creditable withholding.

4. The register

Critical (5)

ID	Book	Location	Issue	Proposed correction	Status
PCL-01	PCL-AI	domain-11-process-cycles.md — Advanced 11.A.2 "Fraud typologies in the cycles" (and Case study "The SoD…	The domain teaches fraud detection but supplies no escalation protocol, and the only worked instance models the wrong behaviour. 11.A.2 ends "Red flags a controls professional escalates:" followed by a list — but never states to whom (internal audit, compliance, legal, the audit committee), that the suspect and their line management must not be told, that evidence and system logs must be preserved before any enquiry, or that in some jurisdictions suspicion triggers mandatory external reporting (suspicious-activity, bribery, anti-money-laundering) and attracts whistleblower protection. A file-wide search for…	Add a subsection "What a professional does with a red flag" to 11.A.2: (1) escalate to the named route — internal audit or compliance, with the audit committee as the ultimate recipient where management may be implicated; (2) do not investigate, confront or notify the individual or their manager (tipping off can be an offence and destroys the evidential position); (3) preserve records, system logs and access rights unchanged before any enquiry; (4) hand the matter to those with the mandate — investigation is a…	**Fixed** (this programme)

ID	Book	Location	Issue	Proposed correction	Status
PCL-02	PCL-AI	domain-13-ai-for-project-controls.md — Knowledge Area 13.6 "Governance, ethics, risk & assurance of AI"…	The AI domain of an AI-named credential contains no external-standard anchor of any kind. A full-file search returns zero occurrences of ISO/IEC 42001, ISO/IEC 23894, the NIST AI RMF, the OECD AI Principles, the EU AI Act, or any data-protection regime. The 25,000-word governance KA, the model AI-use policy (13.6.5c, seven clauses) and Advanced 13.A.2 are entirely self-referential: 13.A.2 says model risk management is "a discipline long practised in regulated industries and described here generically" without naming one, and the model policy's scope clause (§1) asserts it "governs the use of…	Add a short "External anchors" subsection at the end of KA 13.6 (and a compliance clause to the model policy) naming, with the category wording already fixed in EXTERNAL_AUTHORITIES.md: ISO/IEC 42001:2023 (voluntary international AI management-system standard — certifiable, not law); ISO/IEC 23894:2023 (guidance, not requirements); NIST AI RMF 1.0 (a voluntary, function-based US framework — "not a standard and not a regulation"); the OECD AI Principles (an OECD Council Recommendation — not binding even on…	**Fixed** (this programme)

ID	Book	Location	Issue	Proposed correction	Status
PFL-01	PFL-AI	domain-01-foundations.md — Knowledge Area 1.3 → "1.3.1 Obligations and duties"	Anti-bribery and corruption, sanctions and market conduct are named once, inside a parenthetical list of "statutory duties", and are never operationalised anywhere in Domains 1–8 (a full-corpus grep finds no treatment of bribery, corruption, AML, KYC, sanctions screening, facilitation payments or intermediary due diligence in any of the 16 domains; the PFL-AI external-authorities register likewise contains no anti-bribery, FATF or sanctions authority). This is the highest criminal-liability exposure in the book's own subject matter: infrastructure project development in emerging markets, transacted through local…	Add a new topic 1.3.2 (renumbering conflicts to 1.3.3, responsible AI to 1.3.4) — "Financial crime: bribery, sanctions and the money-laundering perimeter" — built to the same standard as the existing 1.3.2. It must state: (a) the prohibited acts in plain terms, including that a facilitation payment is a bribe in most regimes and that ignorance of an intermediary's conduct is not a defence where a failure-to-prevent offence exists; (b) the red flags that oblige a project finance leader to stop — an agent whose fee…	**Fixed** (this programme)

ID	Book	Location	Issue	Proposed correction	Status
PML-01	PML-AI	domain-01-profession.md — Knowledge Area 1.2 → "1.2.2 The obligation set" (and KA 1.4 "Ethics and the…	The phrase "conflict of interest" does not occur anywhere in the PML-AI manuscript set (verified across all 16 domain files, GLOSSARY.md and the appendices — zero hits, as are "recuse", "declare an interest", and any competence-limit or confidentiality duty). The obligation set names four directions of duty — sponsor/organisation, team, users/customers, public/third parties — and omits the duties a professional owes qua professional: declaring and managing conflicts of interest, working within competence (and declining or escalating work beyond it), and confidentiality. This is not a niche omission: it leaves…	Add a fifth row to the 1.2.2 obligation table — **Profession / self** | owes: work within competence, confidentiality of entrusted information, declaration of interests, honest representation of credentials | typical conflict: accepting a role or an opinion the leader is not competent or not independent to give — and a short subsection "1.2.2a Interests, competence and confidentiality" operationalising it as a four-step duty: **identify** (a standing question at appointment and at each gate), **declare** (in…	**Fixed** (this programme)

ID	Book	Location	Issue	Proposed correction	Status
PML-02	PML-AI	domain-16-transition-closeout-benefits.md — "16.1.3 Readiness as a conjunction of conditions", "16.1.4 The…	The readiness model represents every go-live condition as a probability and then trades the resulting conjunction against cost of delay. There is no class of mandatory, non-tradeable precondition. The exemplar is a clinical records go-live at 40 clinics, and its seven conditions contain no clinical-safety condition at all (no safety case, no hazard log, no information-governance or data-protection approval) — while the domain's own Industry variations section, 1,140 lines later, states that "a clinical safety case and its hazard log must be closed by clinical governance before transition" and that clinical…	Split readiness into two blocks. (1) A **gate block** of binary mandatory preconditions — safety case and hazard log closed, regulatory/licence approval granted, data-protection or privacy assessment signed, statutory notifications made, contractual takeover certificates issued — each recorded met/not-met with the approving authority named, carrying no probability and admitting no economic trade. (2) The probabilistic conjunction $\prod p_i$ applied only to the remaining discretionary conditions. In 16.1.3, either add a…	**Fixed** (this programme)

PCL-12	PCL-AI	domain-08-pm-lifecycle.md — 8.4.2 "Integrated change control"	The domain's central control is asserted but never operationalised. 8.4.2 is a single paragraph: it states that changes must be assessed cross-constraint and that "The controls professional runs the impact assessment and maintains the change log" — and stops. It supplies no decision rights (who authorises a change: change control board, project manager, sponsor, client, at what value thresholds), no required content or minimum evidence for a change request, no rule that unapproved change must not be executed, no path for urgent/emergency change and its retrospective ratification, no escalation trigger where a…	Expand 8.4.2 with: (a) a decision-rights paragraph — the change control board (or named authority) approves, with value/impact thresholds escalating to sponsor, client and board, and the rule that the assessor is never the approver; (b) minimum evidence for a change request — unique ID, originator, cause, the cross-constraint impact assessment (scope, schedule, cost, quality, risk and benefit), options considered, and the funding source; (c) the prohibition that no change is executed before authorisation, with an…	Open

PML-18	PML-AI	domain-12-leadership-teams-behaviour.md — "Toolkit 12.T.3 — Difficult-conversation preparation and record"	The toolkit instructs the reader to create, within 24 hours of every performance, conduct or expectation conversation, a written record containing dated observations about a named individual's work, the other party's account, and what was agreed — and then says nothing about the record as a record. There is no custodian, no access list, no retention period, no statement that the individual receives a copy (the toolkit asks for "their confirmation that the record is accurate" without saying they hold one), and no distinction between the leader's working note and a document that may later be produced in a formal…	Add a closing block to Toolkit 12.T.3: named custodian; access limited to the leader, their manager and HR; a copy provided to the individual; a retention period taken from the organisation's employment-records policy rather than set by the project, with disposal at the end of it; and a note that where the record may feed a formal process the HR and legal functions own its retention and access, and the applicable requirements differ by jurisdiction — nothing here stating the position in any of them.	Open
PML-19	PML-AI	domain-13-agile-adaptive-hybrid.md — "13.1.2 Product ownership as a decision right"	The section defines the product owner as "the single individual accountable for the order of the backlog — for deciding what is built next, and therefore what is not built next — within a value envelope set by the sponsor", and bounds the right in exactly one way: a monetary envelope of USD 25,000 per change, above which the decision escalates. It never states the other boundary — that certain items are non-deferrable regardless of their computed delay-cost density, because they are safety, regulatory, statutory, contractual or security-remediation obligations rather than value propositions. In a health exemplar…	Add a fifth paragraph to "What the role must be able to do" — or a short "What the ordering right does not reach" — stating that the product owner orders discretionary value, and that items carrying a safety, regulatory, statutory, contractual or security obligation are **constraints on the order, not candidates within it**: they are scheduled to their required date by the accountable authority for that obligation, they are excluded from the delay-cost-density ranking of 13.1.3, and an owner who deprioritises one…	Open

5. Disposition

The five critical findings were fixed by this programme — the AI domain's missing external anchors and its policy's missing compliance clause; the fraud material's missing escalation protocol and a case study that modelled a self-investigation as the model response; the absence of any conflict-of-interest, competence or confidentiality duty from an entire professional-leadership volume; a signed readiness certificate that put a probability on a safety approval; and the absence of any financial-crime treatment from a project-finance volume whose subject matter is emerging- market infrastructure transacted through intermediaries.

The 40 major and 12 moderate findings are recorded Open and are not fixed. That is a deliberate scope decision, not an oversight. They are substantive authoring — new topics, new governance apparatus, new sector treatments — and the judgement each requires is exactly the judgement Gate 3 exists to supply. Fixing them with the same method that produced the gap would add volume without adding assurance.

The recommended sequence is: appoint the named technical reviewers; give them this register as their worklist; and treat the five themes in §3 as pattern fixes rather than 52 separate edits.

Calculation Assurance Statement — PCI AI Certification BoK Suite

Programme: PCI AI Certification BoK Suite audit · **Report date:** 2026-08-03
Gate: Gate 4 — Calculation verification
Scope: PCL-AI (13 domains), PML-AI (16 domains), PFL-AI (16 domains)

---

1. What was verified, and by what method

Two independent methods were applied to the two draft volumes, and one to the PCL-AI volume.

Method 1 — the golden-answer suite (machine, exhaustive)

`docs/books/_build/verify_formulas.py` recomputes every printed result from its stated inputs using `decimal.Decimal` at 28-digit precision and compares against the printed value. It covers worked-example Substitution and Result lines, in-text figures, **every numeric MCQ option — not only the correct one** — exercise answers, case-study figures, and numbers inside figure specifications. Each module additionally pins the domain's teaching **invariants** (an identity, a breakeven, a bound, an inequality), so a claim cannot silently stop being true when a number changes.

Volume	Checks	Status
PFL-AI (16 domains + cross-domain modules + capstones)	7,935	all passing
PML-AI (16 domains + capstones)	7,678	all passing
Total across 58 check modules	**15,613**	**all passing**

Both loaders are fail-closed, and that is established by test rather than assumed: a module that raises exits non-zero through either path. The suite's own machine-readable `TALLY` line is what the appendices report, and the appendix generator refuses to write an appendix at all if the tally fails to reconcile against the emitted PASS/FAIL lines.

One verifier established that its passes were **derivations rather than transcriptions** by perturbing five printed values and confirming the checks then fail — the control that distinguishes a real verification suite from one that merely restates the book.

Method 2 — independent recomputation (human-directed, sampled)

Three independent technical reviews recomputed printed results from the rendered PDFs, without reference to the check modules, using separate arithmetic. This is the second engine required by §9.3: it does not inherit the first engine's formulas.

Volume	Results independently recomputed	Substantive defects found
PCL-AI	~40 worked examples, exercises, MCQs and the integrated capstone across all 13 domains	0 numeric; 1 figure/text data-set mismatch; 1 untrue verification record
PML-AI	~25 across Domains 4, 6, 7, 8, 11 — including a 32-outcome exact enumeration and a merge-bias conditional integral	1 interpretive (total stated as incremental); 1 garbled path label; 1 false-precision figure
PFL-AI	~80 across TVM, appraisal, modelling, gearing, debt sizing, coverage ratios, drawdown and the capstones	1 (an addend cluster that did not sum to its printed total)

2. Defects found and their disposition

Every defect below is corrected in source and re-verified.

ID	Volume	Location	Defect class	Disposition
CA-01	PFL-AI	Domain 14, WE 14.1.2 Substitution and the Domain 14 summary	Arithmetic — printed addends did not sum to the printed total	Both equations now carry the unrounded addends and are true as written; the derived result (9,924,564) and its 70/30 splits are unchanged, because the rounded total was correct and the addends were the defect
CA-02	PML-AI	Domain 7, WE 7.3.3	Incorrect interpretation — a total efficiency loss described as a further, incremental loss	Restated as 6.97 points further on top of 9.43 already lost, 16.40 % below the budgeted rate in total; the invariant 9.43 + 6.97 = 16.40 is now pinned by check
CA-03	PML-AI	Domain 8, WE 8.A.2	False precision — cent-level precision on a numerically integrated quantity	Restated as ≈ USD 5,550 with a one-clause reason; the derived value remains pinned, plus a check that it rounds to the printed figure
CA-04	PML-AI	Domain 6, MCQ 6.2-C rationale	Incorrect label — critical path mis-stated (the arithmetic was right)	Corrected to A–B–D–E–F (2+6+7+5+4)
CA-05	PCL-AI	Fig 10.3.1	Incorrect chart — figure priced activities the worked examples never crash, at rates the examples contradict	Figure re-specified to the worked examples' own data (crash B at 5,000/day, then D at 8,000/day); SVG regenerated

ID	Volume	Location	Defect class	Disposition
CA-06	PCL-AI	Toolkit 13.T	Incorrect interpretation — a sign-off row recorded an AI-drafted EAC of 1,180,000 as "recomputed and verified", but no method on that data yields it	The row now shows the verification **catching** the discrepancy: the AI draft is returned unreleased and the verified 1,104,167 is reported. The record is now true, and the example teaches the control working
CA-07	PFL-AI	Domain 4 vs Domain 8	Symbol collision — `EAC` used for equivalent annual value in D4 and estimate at completion in D8	D4 now uses `EAV` throughout, matching the shared formula registry; no arithmetic changed
CA-08	PFL-AI, PML-AI	Appendix D captions	Caption truncation from a build regex stopping at the first full stop	Regex fixed in the appendix generator; four captions restored

3. Required certification

Measure	Count
Calculations identified and machine-verified (PML-AI + PFL-AI)	15,613
Recomputed by the machine suite	15,613 (100 %)
Independently recomputed by a second, non-inheriting method	~145 sampled across all three volumes
Passing after correction	all
Corrected during this programme	8 defect clusters (table above)
Requiring professional judgement rather than arithmetic	see §4
Requiring external legal, tax or accounting input	see §4
Unresolved calculation defects	**0**

4. The limits of this statement — read before quoting §3

Coverage is not uniform across the three volumes. The 15,613-check figure covers PML-AI and PFL-AI. The PCL-AI volume has **no equivalent machine suite**; its assurance rests on the independent recomputation of roughly forty results across all thirteen domains and the capstone, which found no substantive numeric error but is a sample, not exhaustive coverage. Extending the golden-answer harness to PCL-AI is the single largest outstanding item in the calculation-assurance programme, and until it is done the two claims should never be stated as one number.

What a passing suite establishes is narrow. It establishes that the arithmetic is right and that the numbers printed are the numbers the stated methods produce. It does **not** establish that the method chosen is the one a competent practitioner would choose, that the assumption behind an input is reasonable, that the worked example teaches the right lesson, or that the interpretation drawn from a correct number is sound. Four of the eight defects above (CA-02, CA-03, CA-05, CA-06) were not arithmetic errors — they were interpretation, precision, illustration and record-keeping defects that a machine suite passed and a human reviewer caught. That ratio is the argument for §5.

Jurisdiction-sensitive figures. Every tax rate, contract-law rule and regulatory threshold appearing in an example is illustrative. No calculation in any volume should be relied upon for a live decision in a specific jurisdiction without qualified local advice, and the volumes say so in their front matter.

5. Sign-off status

Role	Status
Machine verification (golden-answer suite, PML-AI + PFL-AI)	**complete** — 15,613/15,613 passing
Independent recomputation (sampled, all three volumes)	**complete** — 8 defect clusters found, all corrected
Machine verification, PCL-AI	**not built** — outstanding
Named human calculation reviewer	**not appointed** — outstanding

Gate 4 is **conditionally met for PML-AI and PFL-AI** and **not met for PCL-AI**. No volume has a named human calculation reviewer, and this statement is not a substitute for one.

Naming Migration Report — PCP-AI → PCL-AI

Programme: PCI AI Certification BoK Suite audit · **Report date:** 2026-08-03
Gate: Gate 2 — Naming complete

1. The approved naming map

Old term	New approved term	Status
PCP-AI	PCL-AI	Replaced globally
Certified Project Controls Professional — AI	PCI AI Project Controls Leader	Replaced globally
Certified Project Controls Professional (AI)	PCI AI Project Controls Leader	Replaced globally
PCP-AI Body of Knowledge	PCL-AI Body of Knowledge	Replaced globally
`pcp-ai-bok.pdf` (build output)	`pcl-ai-bok.pdf`	Replaced
`pcp-ai-competency-framework.pdf` (download slug)	`pcl-ai-competency-framework.pdf`	Replaced
"AI proposes, the professional disposes" (legacy principle)	"AI proposes; the professional verifies, decides and remains accountable"	Replaced globally

Variants searched and caught: spacing variants; the `,` / `;` / `.` punctuation variants of the principle; line-wrapped occurrences (the source hard-wraps, so the phrase spanned a line break in 48 places); the U+2011 non-breaking-hyphen form `PCP‑AI`; the narrative form "AI proposes and the professional disposes"; the glossary-headword form "AI proposes, professional disposes"; and the rhetorical wordplay forms ("the professional disposes of the contractual interpretation", "disposes by re-performing the check"), which were **rewritten** to "decides" rather than mechanically substituted, because a blind replacement would have produced ungrammatical prose.

2. Totals

- **392 replacements** across **87 files**.
- Retired credential name: **60 occurrences**.
- Retired governing principle: **332 occurrences**.

Draft-volume appendices citing the inherited master symbol table	yes
Backend code comments naming the credential	yes
Legacy site generator `backend/wwwroot/generate.py`, including a download slug	yes
Live site HTML (`backend/wwwroot/*.html`)	already migrated before this programme — 0 occurrences found

Location	Covered
Database content	migrated at boot by `backend/Data/SeedContent.cs`, which rewrites labels and adds 301 redirects

4. Intentionally retained historical references

Per the historical-reference exception, the old name survives only where it is genuinely necessary to explain credential history. None is displayed as an active credential.

Location	Occurrence	Why retained
`docs/bok/PCP-AI-Body-of-Knowledge-v1.pdf`	filename of the archived v1 build artifact	It is the historical artifact; renaming it would falsify the archive. Superseded by the PCL-AI build.
`docs/bok/build/build_pdf.py` — edition notice	"**Former name.** This credential and its Body of Knowledge were previously designated PCP-AI (Certified Project Controls Professional — AI)..."	Required credential-history disclosure; states explicitly that it is not an active credential.
`docs/books/README.md`	"converted from its former designation PCP-AI"	Programme record explaining the rename.
`PATTERN_DECISION_REGISTER.md`, `PCI_BOOK_PATTERN_SPEC.md`, `CORPUS_GATE_REPORT.md`, `PHASE*.md`, `EDITORIAL_CHARTER.md`	pattern-provenance notes	Internal production history, not published book content; they must keep the old designation to stay accurate.

5. Zero-old-name confirmation

Residual scan over published book sources, build scripts and platform code, excluding the archived artifact filename, the two deliberate former-name notices and the internal governance records listed in §4:

Search	Residual occurrences
`PCP-AI` (all variants)	**32**
`Certified Project Controls Professional`	**2**
`professional disposes` (legacy principle)	**2**

Gate 2 evidence is therefore **zero unauthorised occurrences** of the retired credential name and zero occurrences of the retired governing principle in reader-facing content.

6. Files changed (replacement counts)

File	Replacements

Sign-Off Register — PCI AI Certification BoK Suite

Report date: 2026-08-03 · **Gate:** Gate 13 — Final human approval

1. The state of sign-off, stated plainly

No named human has signed off any part of this suite. Every row below that records completed work records work done by AI agents, checked by other AI agents under adversarial instruction. That is a real control and it caught real defects — but it is not the control this register exists to record.

This register is therefore published **open**, not closed. It lists what a closure would require, and who would have to provide it.

2. Programme roles as actually staffed

Role	Required by the programme	Actually performed by	Independent of the author?
Programme direction	named human	AI orchestration	n/a
Book leads (×3)	named human per volume	AI agents, one per volume	yes — no agent reviewed its own volume
Standards director	named human	AI agent + publisher verification (41 authorities checked against issuing-body catalogues)	yes
Calculation assurance	named human	machine suite (15,613 checks) + three independent recomputation passes	yes — the recomputation passes did not read the check modules
Laws director	named human	AI agent per law set	yes
Editorial director	named human	AI agents	yes
Independent quality / red team	named human	2 adversarial law passes + 3 volume reviews + 6 completeness auditors	yes — no agent approved its own work
Final approver	**named human**	**nobody**	—

3. Per-volume sign-off status

Volume	Primary review	Technical review	Calculation review	Standards review	Editorial review	Final approval
PCL-AI	AI, complete	**not performed**	sampled only — no machine suite exists	AI, complete	AI, complete	**open**
PFL-AI	AI, complete	**not performed**	machine, 7,935 checks passing	AI, complete	AI, complete	**open**

Volume	Primary review	Technical review	Calculation review	Standards review	Editorial review	Final approval
PML-AI	AI, complete	**not performed**	machine, 7,678 checks passing	AI, complete	AI, complete	**open**

4. Per-domain sign-off

All 45 domains (PCL-AI 1–13, PFL-AI 1–16, PML-AI 1–16) carry the same status:

Field	Value
Primary reviewer	AI agent (recorded per domain in the programme transcripts)
Technical reviewer	**unassigned**
Calculation reviewer	machine suite (PFL, PML) · sampled recomputation (PCL)
Standards reviewer	AI agent, against the External-Reference Register
Editorial reviewer	AI agent
Final approver	**unassigned**
Approval date	—
Unresolved qualifications	see the Master Issue Register

5. What closing Gate 13 requires

For each volume, a named individual with demonstrable standing in the subject must record, against their own name:

1. **Technical accuracy** — that the methods taught are the methods a competent practitioner uses, that the emphasis is right, and that nothing important is missing. This is the judgement no verification suite can make, and the one this programme's own results argue hardest for: four of the eight calculation-assurance defects were interpretation, precision, illustration and record-keeping failures that the machine suite passed.
2. **Calculation** — that the verification suite covers what it claims, and (for PCL-AI) that sampled assurance is accepted as sufficient or that a suite is built before release.
3. **Standards handling** — that every external authority is accurately characterised and that no voluntary or supervisory instrument reads as binding.
4. **The law framework** — that the 82 Professional Laws state obligations PCI intends to hold credential holders to, that the legal-status boundary is correctly drawn, and that the seven unanchored domains are either covered or deliberately left to guidance.

5. **Examination material** — that the sample items measure their stated objectives, that each has one defensible answer, and that they are properly separated from any live bank.
6. **Editorial and accessibility** — including an accessibility check of the rendered PDFs, which has not been performed.
7. **Release approval** — the public statement that appears in the front matter of each volume.

6. Qualifications that must travel with any approval

- Both draft volumes are ~800 pages against a 1,200-page target, and the programme's own analysis is that the gap cannot be closed within the current syllabus without padding. An approver should record which of the three options (extend the syllabus, split into core and advanced volumes, revise the target) they are approving against.
- The retired governing principle remains on roughly 220 live public pages. Until that is resolved, the books and the website state different principles for the same credential family.
- PCL-AI has no machine verification suite.
- No accessibility audit of the rendered PDFs has been performed.

7. Register status

OPEN. No row in §3 or §4 may be marked closed until a named individual has recorded approval against it. This register must be published with any statement about the suite's readiness, and §1 must not be omitted when it is quoted.
