

Platform Integration

VERSION 1.0 · DRAFT

2026-08-05

PROJECT CONTROLS INSTITUTE GLOBAL, INC.

AI proposes. The professional disposes.

— About this document

Series	Publication Framework
Version	1.0
Status	draft
Date	2026-08-05
Unresolved placeholders	1

Notice. This document is an educational publication of Project Controls Institute Global, Inc., and does not constitute accounting, tax, legal, financial or other professional advice. It must not be relied upon as such. Where a topic depends on the contract or the governing law, entitlement and treatment vary by jurisdiction; take local advice.

Standards. Standards and frameworks are referred to by name and described in this publication's own words. No standard's text, tables, diagrams or question banks are reproduced. All trademarks remain the property of their respective owners, and no endorsement by any standards body, employer or vendor is implied or should be inferred.

Status. Project Controls Institute Global, Inc. is a Delaware Non-Stock Corporation. The Institute has been developed with reference to ISO/IEC 17024 personnel-certification principles and is **not accredited** by ANAB, IAS or any other accreditation body. It intends to seek 501(c)(3) recognition, which has not been granted. No governmental approval, academic equivalence, or guaranteed employment, promotion or salary outcome is claimed or implied.

Examples. All worked examples are illustrative and fictional. Figures are chosen to demonstrate a method, not to describe any real project, organisation or market. Sample examination items, where they appear, are study material maintained separately from any live examination bank.

Completeness. Passages marked **[CONFIRM: ...]** are operational or market facts that have not yet been confirmed from a cited source. A document carrying them is a working draft and is not approved for publication.

Platform Integration

How the 100 documents reach readers through the PCI platform, and — critically — how they sit alongside the document libraries the platform **already ships**.

This file exists because the framework was written after the platform, not before it. Ignoring what is already seeded would produce a second, competing library and a confused Downloads Centre.

— 1. What the platform already publishes

Three seeded libraries already populate `public_documents`:

Seed	What it ships	Category
<code>backend/Data/PublicDocsSeed.cs</code>	The governance and candidate document set (policies, handbooks, routes, privacy, fees)	<code>policies, certification-governance, candidate-handbooks, application-routes, exams, ...</code>
<code>backend/Data/TemplatesLibrarySeed.cs</code>	25 CSV templates mirroring the Simulation Lab engines	<code>templates</code>
<code>docs/downloads/</code> (built via <code>build_docs.py</code>)	Candidate handbook, examination blueprint, code of professional conduct, glossary, formula sheet, sample questions, study guide	—

None of these are superseded by this framework. The relationship is defined in §3 and §4.

— 2. The `public_documents` model

Every document is **version-chained**: each version is its own row sharing a stable `doc_group` — the public identifier. `is_current` flags the live version, and `supersedes_id` points at the row it replaced. A public request only ever sees rows with `status='published'` **and** `visibility='public'`, so drafts, internal documents, withdrawn and archived versions are never distributed.

That model maps onto this framework almost exactly, which is convenient rather than accidental — both were built around the idea that a published document's history must survive its corrections.

Framework front matter	public_documents column	Note
id (e.g. BPG-08)	doc_group = pub-bpg-08	The ID is the permanent citation key; the <code>doc_group</code> is its public form. Never reused, even after retirement.
title	title	
summary	description	Written once, used in the Downloads Centre card and the LinkedIn blurb
version	version	A new version inserts a new row; it never overwrites bytes — see §5
status	status	Mapped in §2.1
series	category	Mapped in §2.2
related	related_groups	Comma-separated <code>doc_group</code> values
gated: true	—	Gating is an application concern, not a document column — see §6

2.1 Status mapping

Framework	Platform status	Platform legal_review_status
draft	draft	draft
in-review	under_review	internal_review_completed
approved	approved	external_legal_review_completed
published	published	approved_for_publication
retired	withdrawn or superseded	unchanged

Note the platform's `legal_review_required` state. Series S04 (ethics), S05 (certification handbook) and S06 (blueprint) carry contractual and quasi-regulatory weight; they route through `legal_review_required` before `approved`, and the framework's own gate 7 (`GOVERNANCE-AND-REVIEW.md` §3) is not a substitute for that.

2.2 Category mapping

Series	category
S01 PCB Body of Knowledge summary	certification-governance
S02 AIG AI guide	general
S03 CMP Competency frameworks	certification-governance
S04 ETH Code of ethics	policies
S05 CER Certification handbook	candidate-handbooks
S06 EXB Exam blueprint	exams
S07 CAR Career roadmap	general
S08 SAL Salary and skills	general
S09 BPG Best practice guides	general
S10 TPL Free templates	templates

— 3. S10 and the existing CSV template library — the important one

The platform already publishes **25 CSV templates**. Series S10 publishes **16 template documents**. These are not duplicates, and the distinction must be preserved or both become worse.

The CSVs are instruments. The S10 documents are the method.

The CSV library deliberately ships **without embedded formulas** — every field is neutralised against spreadsheet-formula injection, so a template carrying live formulas would be indistinguishable from an attack payload. Each CSV therefore carries columns, worked example rows and a short "how to compute" note.

That is exactly the gap S10 fills: the formula stated in words and as a spreadsheet expression, the completion instructions field by field, a worked fragment, the common mistakes, and the rules for adapting the instrument safely. A CSV cannot carry any of that.

3.1 Where an S10 document has a CSV counterpart

Pair them: the Downloads Centre card links both, and the S10 document names the CSV in its When to use this section.

S10 document	Existing CSV doc_group
TPL-02 WBS and dictionary	template-wbs-dictionary
TPL-03 CBS and code of accounts	template-cost-breakdown
TPL-05 Progress measurement sheet	template-progress-measurement
TPL-07 EVM calculation sheet	template-evm-tracker
TPL-09 Cash flow forecast	template-cash-flow
TPL-10 Risk register	template-risk-register
TPL-11 QSRA input sheet	template-three-point-estimate
TPL-12 Change order log	template-change-log
TPL-16 Lessons learned register	template-lessons-learned

3.2 Where an S10 document has no counterpart

These are genuinely new, and are documents rather than data tables — a form, a plan structure, a narrative skeleton or an assessment instrument, none of which reduces to a CSV grid:

[TPL-01](#) controls execution plan · [TPL-04](#) baseline change request · [TPL-06](#) monthly report · [TPL-08](#) EAC scenario comparison · [TPL-13](#) claim and EOT narrative structure · [TPL-14](#) schedule quality review checklist · [TPL-15](#) project controls health check

3.3 Where the CSV library has no S10 counterpart

Sixteen CSVs stand alone, including resource histogram, bill of quantities, productivity log, schedule network, earned schedule, procurement log, decision matrix, portfolio scorecard, data quality check, RAID log, milestone tracker, contingency drawdown, variance analysis, status report, S-curve data and stakeholder register.

These are candidates for a future S11, not gaps in the current hundred. Do not quietly add them to S10 — the registry count is a contract.

— 4. S05, S06 and the existing candidate documents

[docs/downloads/candidate-handbook.md](#), [examination-blueprint.md](#) and [code-of-professional-conduct.md](#) are live documents. S05, S06 and S04 expand and eventually supersede them.

Sequence matters. The existing documents stay live and unchanged until their replacements are [approved](#). At switchover the old document is marked [superseded](#) (never deleted, never byte-swapped) and the new version is inserted into the same `doc_group` so the public identifier and every historical link survive. The platform enforces this: once a version has left the pre-publication pipeline, replacing its bytes in place returns `409 published_file_immutable`.

That 409 is a feature. It is the same principle as [GOVERNANCE-AND-REVIEW.md](#) §6: a published document is corrected in the open, with a new version, not quietly overwritten.

— 5. Publishing a document

1. Author in this framework; pass the gates in `GOVERNANCE-AND-REVIEW.md` §3.
 2. Resolve every `[CONFIRM: ...]` placeholder. `placeholders: 0`.
 3. Render to PDF for the Downloads Centre; keep the Markdown as the editable source of record.
 4. Insert a new `public_documents` row with the mapped `doc_group`, category and status.
 5. For a revision, insert a **new row** in the same `doc_group`, set `supersedes_id`, move `is_current`. Never edit published bytes.
 6. Schedule the LinkedIn slot from `PUBLISHING-CALENDAR.md`.
-

— 6. Gating

Six documents are gated (`gated: true`): CER-01, SAL-05, TPL-06, TPL-14, TPL-15.

Gating is an application concern — an email-capture step in front of the download — not a `public_documents` column. `visibility` is `public` versus `internal`, which is a different question entirely: an `internal` document is never distributed at all.

Do not implement gating by marking a document `internal`. That would remove it from the public catalogue rather than putting a form in front of it, and it would break the download-count reporting that makes the gate worth having.

The default is ungated, and teaching is never gated — `LINKEDIN-PLAYBOOK.md` §6.

— 7. What this framework does not touch

The ~216 server-rendered marketing pages, the content-injection system (`Core/PageContent.cs`, `CertCatalogue`, `ListSections`, `PriceTags`) and the `site_content` / `page_blocks` tables are a separate mechanism with its own editing surface. A document in this framework may be linked from a page, but it never becomes page content, and nothing here requires a schema change or a redeploy.
